

A Continuous variables

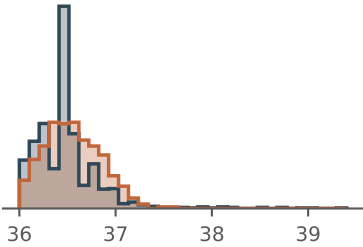

Weight

1.5% missing

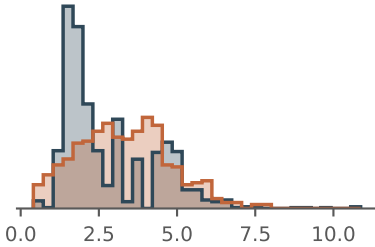

Temperature

1.8% missing

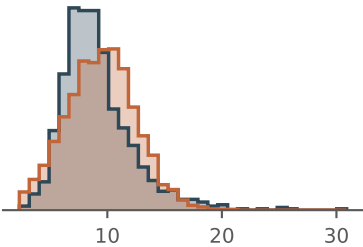

Observed Imputed (m = 20)
log(h since ingestion)

2.1% missing

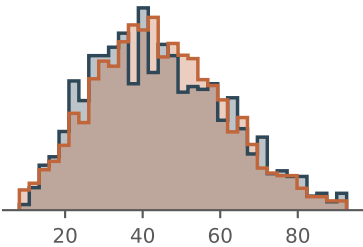

White cell count

14.3% missing

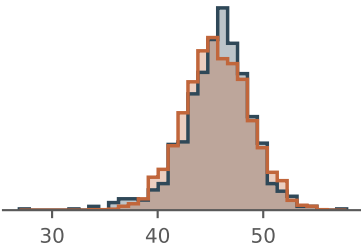

Neutrophil %

14.3% missing

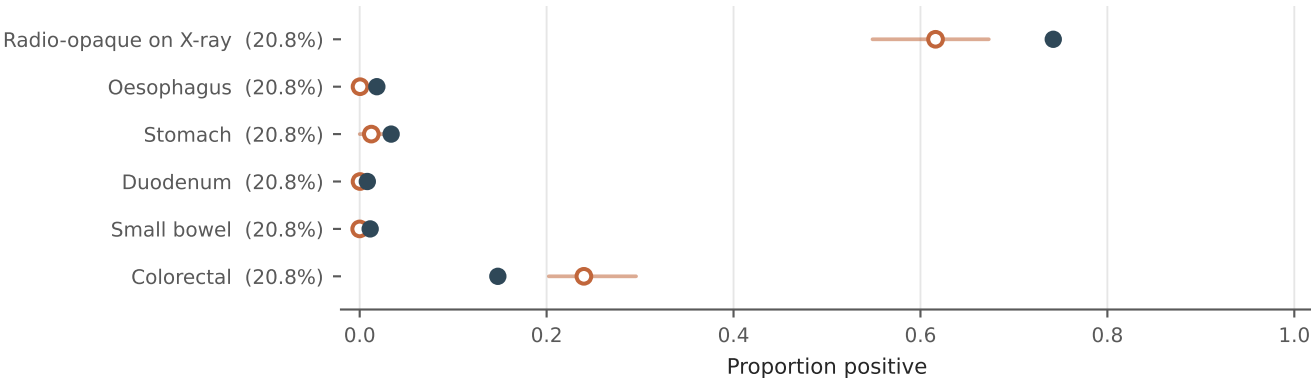

Albumin

11.4% missing

B Binary variables

Distributions of observed values against values drawn by chained-equation multiple imputation, pooled over m imputations; in B the horizontal bar spans the m imputation-specific proportions. Missingness here is informative rather than random — children taken quickly to theatre for endoscopic removal often had no bloods drawn — so imputed and observed distributions are not expected to coincide. What the figure is meant to show is that imputed values stay within a clinically possible range and that any shift runs in the direction the missingness mechanism predicts.
